Pollinator Plan

This Plan was initiated by Úna FitzPatrick (National Biodiversity Data Centre) and Jane Stout (Trinity College Dublin), and then developed by a fifteen member All-Ireland steering group. The final Plan was produced by the steering group following a consultation phase, which included both public and stakeholder engagement. During the stakeholder engagement a total of 70 organisations were invited to comment on the Plan. The stakeholder engagement was not an exhaustive process and it is acknowledged that not all relevant organisations will have been contacted. It is hoped that more organisations will come on board to support the Plan over the coming years.

The Pollinator Plan was developed by the steering group and published by the National Biodiversity Data Centre.

The National Biodiversity Data Centre is an initiative of the Heritage Council and is operated under a service level agreement by Compass Informatics. The Centre is funded by the Department of the Arts, Heritage & the Gaeltacht and the Heritage Council.

Thanks to botanical artist, Shevaun Doherty, for the front cover painting - Garden bumblebee (Bombus hortorum) on Knapweed.
I am delighted to provide the foreword for this All-Ireland Pollinator Plan. The publication of such a Plan on an All-Ireland basis is indicative of the fact that there is a real issue to resolve, and very importantly that the actions identified, if implemented, will contribute considerably to reversing pollinator decline.

Everyone has responsibility to ensure implementation. Gone are the days when we can choose to ignore warning signs. Our science is sound, the data are available and everyone knows what has to be done. Our concern has to be to get it done within the timeframes identified and to secure the resources that are required. The alternative is not acceptable, and should not be acceptable to anyone.

Those champions of this initiative that gave of their time so freely as part of the steering group deserve both congratulations and ongoing support. The actions that have been identified are relevant to the public as a whole. They will improve the quality of the places in which we live, and work, and which we encourage tourists to visit. The Plan is about improving the quality of our environment, our sense of well-being, and our own contentment when we make things better than they were. That is the least we should be committed to doing. The Heritage Council will continue to find ways to encourage others to play a fuller part in the implementation of this Plan.

Michael Starrett
Chief Executive

The Heritage Council
July 2015
The All-Ireland Pollinator Plan 2015-2020 aims to create an Ireland where pollinators can survive and thrive.

**Irish pollinators are in decline.** The problem is serious and requires immediate attention to ensure the sustainability of our food production, avoid additional economic impact on the agricultural sector, and protect the health of the environment.

This is a shared plan of action. By working together we can collectively take steps to reverse pollinator losses and help restore populations to healthy levels. Over the next five years, this Plan will build a solid foundation to bring about a landscape where pollinators can flourish.

The loss of natural and semi-natural habitats has been a key driver in pollinator declines. At its core, this Plan is about providing food and shelter across all types of land so that our pollinators can survive and thrive. It creates a framework to bring together pollinator initiatives across the island, so that with coordination and cooperation we can achieve our goal.

If we don’t protect our pollinators it will affect the food industry. Without the pollination service freely provided by our bees and hoverflies, it would be increasingly difficult and expensive for farmers to produce some crops at current scales, and could result in a loss of consumer choice for Irish grown products. The beauty of the Irish landscape would also be affected without pollinators to maintain the diversity of our wild plants and support healthy ecosystems.

The plan has 5 objectives:

1. **Making Ireland pollinator friendly**
   By focusing on actions that can be taken on farmland, public land and private land, we want to achieve a joined-up network of diverse and flower-rich habitats to support pollinators across Ireland.

2. **Raising awareness of pollinators and how to protect them**
   By working together we want to achieve an increased awareness of the importance of pollinators and the resources they need to survive.

3. **Managed pollinators – supporting beekeepers and growers**
   By supporting beekeepers and growers we want to achieve healthy, sustainable populations of managed pollinators that can play a full role in delivering pollination services.

4. **Expanding our knowledge on pollinators and pollination service**
   By continually addressing gaps in our knowledge through research, we want to achieve an evidence base that directs us towards the best and most cost-effective ways to protect our pollinators into the future.

5. **Collecting evidence to track change and measure success**
   By building up our knowledge on where pollinators occur and how they are changing (including in response to management actions) we want to achieve a dynamic Plan that is targeted and effective.
Who is involved?

This Plan is a call to action. Every one of us can help.

At time of print, the following organisations have agreed to support this Plan and are committed to working together on its implementation. This is not a closed list, it is hoped that during the life of the Plan other organisations will also agree to get involved:

- National Biodiversity Data Centre
- Trinity College Dublin
- Heritage Council
- Northern Ireland Environment Agency
- Department of Arts, Heritage and the Gaeltacht (ROI)
- Department of Agriculture, Food & the Marine (ROI)
- Department of Agriculture and Rural Development (NI)
- Department of the Environment (NI)

- Woodlands of Ireland
How will the objectives be achieved?

Some goals may be achieved using existing policies and initiatives. Others will require us to do things differently.

Achieving targets through policy and government initiatives
The implementation of these existing policies can contribute to the success of the Pollinator Plan:
- Actions for Biodiversity 2011-2016, Ireland’s 2nd National Biodiversity Plan (DAHG)
- Revised Northern Ireland Biodiversity Strategy 2015 (DOE)
- Republic of Ireland Rural Development Programme 2014-2020 (DAFM)
- Northern Ireland Rural Development Programme 2014-2020 (DARD)
- National Action Plan for the Sustainable Use of Pesticides 2013 (DAFM)
- UK National Action Plan for the Sustainable Use of Pesticides 2013 (DEFRA)
- Biodiversity Duty under the Wildlife and Natural Environment Act (NI) 2011
- Planning Policy Statement 2015 (DECLG)
- Strategic Planning Policy Statement 2015 (DOE)

Achieving targets through new projects
It is expected that various groups, including academics, communities, environmental groups, local authorities etc., will take particular objectives of this Plan and make them their own, developing new projects to achieve them. In this, it will be necessary to look to national funding instruments and their support agencies as well as to investigate European funding instruments (e.g. EU LIFE programme; European Regional Development Fund - INTERREG).

What is pollination and why is it important?
Pollination occurs when pollen is moved within flowers or carried from flower to flower by pollinating animals or by the wind. The transfer of pollen between flowers of the same species leads to fertilisation, and successful seed and fruit production for plants. Pollination ensures that the plant will produce full-bodied fruit and viable seeds. For crop producers this means reliable yields of high quality produce, and for consumers it means the availability of a range of fruit and vegetables at an affordable price. In the wider landscape, it means a profusion of fruits and seeds for animals to eat, and a continual renewing of our wildflower resource.
Economy & Wealth

Reduction in the diversity and/or abundance of pollinators can reduce crop yield. The annual value of pollinators for human food crops has been estimated at €153 billion world-wide\(^1\), £603 million in the UK\(^2\), and at least €53 million in the Republic of Ireland\(^3\). Regional estimates of the value of pollinators to individual crops have also been made, with values of over £7 million per annum for apples in Northern Ireland\(^4\) and €3.9 million for oilseed rape in the Republic of Ireland\(^5\). The cost of replacing pollination services provided by animals by artificial means (e.g., human hand pollination or pollen dusting) can be substantially higher\(^6\). Animal-pollination can also improve the shelf-life of soft fruits, further increasing their value\(^7\).

In comparison to other countries, Ireland doesn’t currently grow large numbers of crops that are pollinator dependent. However, globally the market share of pollinated crops is rising\(^8\) and in Ireland within the last ten years the value of soft fruit, field vegetable, and apple production has increased by 17, 21 and 24% respectively (see table for information sources). The Food Harvest 2020 strategy (DAFM) and the Going for Growth Strategy (Agri-Food Strategy Board, NI) want to ensure that the Agri-food sector contributes to the maximum extent in our export-led economic recovery. For this vision to materialise, pollinators will have a key role to play in maximising yields from our current crops and those that will be important in the future. The real economic value of pollinators to the Irish economy is likely to be greater than currently estimated. Current evaluations don’t take into account the value of pollinators to forage crops (clovers), in pest control (e.g., the role of hoverflies in protecting winter wheat crops), or their value to private gardeners and communities who grow a wide range of pollinator-dependent fruits and vegetables. Pollinators play an important role in maintaining healthy farm ecosystems which are a prerequisite for sustainable agricultural production. Maintaining biodiversity in the farm system future-proofs how the land can be used for generations to come. It is important to accept that if wild pollinator species were to be lost from the Irish landscape, they could not be replaced, regardless of monetary input.

Sources: DAFM - National Soft Fruit & Protected Vegetable Census 2013; National Field Vegetable Census 2009; National Apple Orchard Census 2012
Animal-pollinated crops are known to be crucial for providing vitamins, anti-oxidants and other essential nutrients to the human diet\(^8\). In addition, pollination has also been shown to improve the nutritional value of some crops\(^11\). For growers, a loss of pollinators means lower crop yields or reductions in quality, and for consumers it means reduced choice and higher prices for the fruits and vegetables that are essential in our diet.

Pollinators also contribute directly and indirectly to human well-being in other ways. There are known mental health benefits from contact with greenspaces which increase with the quality of the biodiversity\(^12\). People derive pleasure from bees and pollinator-dependent habitats such as flower-rich meadows. The value of this is harder to determine, but is demonstrated by public support for organisations such as Limerick’s Buzzing and the UK Bumblebee Conservation Trust.

Without pollinators it would be extremely difficult to have a healthy balanced diet
Wildlife & Landscape

Pollinators play a key role in our ecosystems. In taking action to protect them, we start a chain reaction that has positive benefits for the general health of our environment. Bees and hoverflies don’t just pollinate crops, they also help maintain the diversity of wildflowers that we have in Ireland. In temperate zones an estimated 78% of flowering plants require animal pollination. Without these wildflowers, the Irish landscape, cherished by us and crucial to our tourism sector, would be a less beautiful and colourful place. Plants are the building blocks of our natural heritage; providing food and shelter for our birds and mammals, and habitats that enhance many other animal populations, including many insects that attack crop pests and provide additional financial benefits.

Pollinators are tangible. We can see them and relate to them. Monitoring their numbers, diversity and range helps us to understand how effective our conservation measures are. By protecting and enhancing the habitats they need, we can help create an Ireland with a healthy and resilient biodiversity that provides us with the ecosystem services on which we are reliant (ecosystem services are the outputs from natural systems that contribute to human wellbeing).

Protecting pollinators helps protect the general health of our environment.
Who are the pollinators in Ireland?

Although a range of animals visit flowers to collect food (nectar and/or pollen), the most important pollinators in Ireland are insects; particularly bees and flies.

Globally, bees are the most important pollinators because they visit flowers to collect pollen for their larvae, as well as feeding exclusively on the nectar of flowers as adults. Hence, the entire life-cycle of bees is dependent on interactions with flowering plants. Of the 100 crops that provide 90% of the world’s food supply, 71 are pollinated by bees. In Europe alone, 84% of the 264 crop species are animal pollinated and 4,000 vegetable varieties exist thanks to pollination by bees. While adult hoverflies feed mainly on nectar and pollen, the larvae of many species are voracious predators of aphids and other pests. As a result, hoverflies contribute to both pollination and pest control.

Managed pollinators

Managed pollinators are those that have some of their needs looked after by humans. The most important managed pollinator in Ireland is the honeybee, which has long been domesticated for honey production and/or crop pollination. Although we often associate it with honey, the honeybee’s role as a pollinator is of far greater economic value. Within the last 20 years, one species of bumblebee has also been employed as a managed pollinator in Ireland. *Bombus terrestris* colonies are imported on an annual basis from other EU Member States to pollinate high-value crops like strawberries and tomatoes in glasshouses and polytunnels. They are also used on a smaller scale within apple orchards.
Wild pollinators

Wild pollinators exist naturally within the environment and are now known to be crucial for maintaining pollination services. In Ireland, there are 98 different species of bee, including the familiar honeybee (1 species) and bumblebees (20 species). The remaining species are solitary, meaning they do not form colonies. Only the honeybee produces commercially extractable honey. Solitary bees are often extremely efficient pollinators. Studies in apple orchards have shown that a single mason solitary bee can do the work of hundreds of honeybees\(^\text{15}\). The economic contribution of pollination by wild bees has been assessed as £1,800 or $3,000 per hectare\(^\text{16}\).

There are 180 species of hoverfly in Ireland. The precise contribution of hoverflies to pollination service is not well understood, but research on oilseed rape has suggested their pollination efficiency is about one fifth that of wild bees\(^\text{17}\). Hoverflies pollinate a much smaller range of plant species due to the fact that they have unspecialised mouth parts and forage mainly on open flowers where the nectar/pollen are not hidden. Very recent studies have shown that non-hover flies also play a role in crop pollination\(^\text{18}\).

A range of factors have contributed to recent colony losses in honeybees, and have caused widespread worry with regard to crop pollination, particularly in North America\(^\text{19}\). Concerns about global honey bee declines have highlighted the risks associated with the reliance on a single pollinating species. Whilst the honeybee is an important crop pollinator, recent studies in the UK have shown that it is not as important as previously believed\(^\text{20}\), and it makes up only a small fraction of insect visits to flowers in Irish agricultural systems\(^\text{21}\). The importance of wild, non-managed bees as pollinators of not only crops, but also wild plants is becoming more and more apparent\(^\text{22,23,24,25}\).

Recent studies now indicate that a diversity of pollinator types is important for maximizing pollination service\(^\text{26,27,28}\). For example, in field studies covering 600 fields and 41 crop systems worldwide, fruit set increased significantly with wild-insect visitation in all systems, whereas only 14% of systems experienced increases with honeybee visitation. However, maximal fruit set was only achieved where both wild pollinators and honeybees were present\(^\text{24}\).

Other insects such as butterflies, moths, beetles, wasps, and ants visit flowers and carry out small amounts of occasional pollination. Although these insects may be frequent flower visitors, their presence does not always result in consistent or successful pollination. While these insects may not contribute as much to crop pollination in Europe as bees, some species do contribute to pollination of some of our native plants e.g., Butterfly Orchids are only pollinated by night flying moths.

"The economic contribution of pollination by wild bees has been assessed as £1,800 or $3,000 per hectare\(^\text{16}\)"

To provide stable pollination services for our crops, crop wild relatives (potential future crops) and other wild plants, we need healthy honeybee colonies in combination with high abundance and species richness of wild bee populations, as well as other wild pollinators such as hoverflies.
Both managed and wild pollinators are declining in Ireland

Are pollinators under threat in Ireland?

Recent research has shown that more than half of Ireland’s bee species have undergone substantial declines in their numbers since 1980, with 30% of species considered threatened with extinction from Ireland according to IUCN criteria. Three bee species that occur in Ireland are also threatened with extinction at the European level and an additional four species are near threatened. Unfortunately, we don’t have historical data to assess changes in the abundance of our common wild pollinator species in Ireland. The All-Ireland Bumblebee Monitoring Scheme was established in 2011 to provide these data on bumblebees into the future.

All bee larvae are fed exclusively on pollen

What do wild pollinators need?

The needs of managed honeybees are very different to those of wild pollinators. Beekeepers can move colonies to where forage sources are available, and can provide extra resources over the winter. Wild pollinators are much more dependent on their immediate environment. All bee larvae are fed exclusively on pollen, with nectar providing an important energy source for the adults. Wild bees need pockets of flower-rich habitat across the landscape (including grasslands, sand dunes, peatlands, woodlands, parks, roadside verges, hedgerows and gardens) to provide them with nesting areas and a diverse diet. While common perennial wildflowers like clovers, vetches and knapweeds are excellent food sources, many bedding plants and annuals are not rich in pollen or nectar, and provide little support to our pollinators.

Well-managed hedgerows can provide good food sources, safe places to nest, and linking corridors between different habitats. They are a vital resource for maintaining pollinator populations, particularly within intensively managed farmland. Road verges can also provide a refuge for wildflowers and if managed appropriately can be an important wildlife corridor.

Hoverfly larvae are very varied in how they feed. Many species feed on insect crop pests like aphids, leaf hoppers and scale insects. Others feed on plants, or on dead or decaying organic matter. Many adult hoverflies feed on pollen/nectar during their very short life stage which generally lasts from a few days to a few weeks.

Well-managed hedgerows are a vital resource for maintaining pollinator populations
Life Cycle: Bumblebees

Most bumblebee queens emerge from hibernation in early spring. Some species are associated with grassland floras and don’t emerge from hibernation until early summer when these resources are most likely to be available.

Winter
- New queen goes into hibernation until the following spring
- Mated new queen forages to build up reserves before hibernation. Workers, males and old queen die

Spring
- Forages on flowers and finds a nest site
- Prepares a pollen loaf and a nectar pot and starts laying eggs fertilised with sperm stored from previous year
- Female workers emerge and take over nest duties. Their main job is to collect pollen to bring back to feed the developing larvae. The queen remains in the nest laying eggs

Summer
- In mid-late summer the queen lays unfertilised eggs which will become males, and more fertilised eggs which will become new queens

Autumn
- New queens and males leave the nest to find mates
- Female workers emerge and take over nest duties. Their main job is to collect pollen to bring back to feed the developing larvae. The queen remains in the nest laying eggs

Queen emerges from hibernation

The length of the bee’s tongue determines what flowers the bee can feed on, with long-tongued species being more adapted to feeding on plants with long tubular flowers.

Bumblebee queens make their nest on the surface of the ground or just underneath, generally in long grass, or bracken, often at the base of a hedgerow. They will occasionally use an abandoned rodent nest.
Some solitary bees are generalists and feed on a range of plant species while others are specialists and are dependent on only one or a small number of species (e.g. Willow).

Females and males emerge from hibernation after mating, the female prepares a nest. Female lays eggs and leaves a food supply of pollen. Fertilised eggs become females, unfertilised eggs become males. 

The eggs hatch and the larvae eat the food left by the parent. The larvae then overwinter in a cocoon. Males and females die. Some solitary bees emerge as adults at various times during the spring and summer depending on the species and whether their preferred flower type is available.

Life Cycle: Solitary Bees

Solitary bees take one whole year to pass through a complete life cycle, and may only survive as adults for a few weeks. This isn't long enough for them to raise their offspring, so the young bees have to fend for themselves. Some species are cavity nesters and will nest in hollowed twigs or holes in wood or masonry. One species, Osmia aurulenta, lives on sand dunes and will only nest in empty snail shells. Most solitary bees in Ireland are mining bees, and make their nests in bare ground or in south facing banks of stable soil, clay, sand or peat.
What are the pressures causing a decline in Ireland’s pollinators?

Habitat loss, fragmentation and degradation - Homelessness

Loss of natural and semi-natural habitats has been a key driver in pollinator declines. The availability of food plants and nesting sites has been drastically reduced through conversion of low-intensity farmland and semi-natural land to intensive farmland, forestry and urban/industrial use. Declines have occurred across all habitats from grasslands to woodlands, sand dunes, peat lands, and mature hedgerows. Those areas of habitat that remain have also declined in quality. This change has had most impact on wild pollinators because they are totally reliant on resources available in the landscape. It has been shown that the number of visits to crop fields by wild pollinators tends to drop with distance from semi-natural areas\(^31\). Effective pollination by wild pollinators requires crop land to be interspersed with more natural areas requiring a landscape scale/farm-wide approach.

General declines in wildflowers within the landscape - Hunger

It is important that pollinators have a balanced diet from a range of plant species. They require food (nectar and pollen) throughout their active foraging season which lasts from early spring until late autumn. Declines in wildflowers are largely due to changing farming practice, particularly the movement from hay to silage production\(^23\). Increases in the amount of fertiliser applied to arable fields has resulted in increased crop yields, but has led to a strong decline in species diversity and flower richness within managed fields\(^33\) and in semi-natural habitats adjacent to fertilised fields\(^34,35\). Our tendency to tidy up the landscape rather than allowing wildflowers to grow along road sides, field margins, and in parks and gardens is also playing a role in fewer of these resources being available. Maintaining pollination service requires providing a sufficient abundance and diversity of food plants across the landscape for our pollinators from early spring to late autumn.
Pests and disease - Sickness

When managed pollinators are imported into Ireland, they can inadvertently bring with them new pests and diseases. Pests and diseases are the main threat to honeybees, particularly an introduced parasitic mite (Varroa destructor), other invertebrates, bacteria, fungi and viruses. In 2006, nearly three quarters of 135 apiaries surveyed across the Republic of Ireland were infected with Varroa destructor. Wild bees may be affected by disease transfer from imported bumblebees that have been released in glasshouses and polytunnels, and by pests and diseases traditionally considered confined to honeybees. Emerging pests and diseases are considered one of the key risks to wild pollinators, particularly bee populations. Vigilance and swift action from those working with managed pollinators and assessing potential future threats is essential.

Pesticides - Poisoning

To meet global population growth and resultant food demand, the pressure on pesticides (insecticides, herbicides, fungicides) to deliver higher standards for crop protection has increased; with agriculture currently using the highest volume of pesticides than at any other point in history. These insecticides, herbicides and fungicides are applied to crops, but reach the pollinators through pollen, nectar, and through the air, water or soil. Although herbicides and fungicides may not have direct toxic effects on pollinators, herbicides reduce the amount of food available, and fungicides may interact with other pesticides and have negative impacts on bees. Insecticides can get into the nectar and pollen either as a result of foliar spraying or via systemic treatments whereby the pesticide is taken up by the plant and expressed in all plant tissues. Although the relative role of pesticides in global pollinator declines remains poorly understood, it is now more evident than ever that some insecticides show clear negative effects on the health of pollinators, both individually and at the colony level. Whilst all pesticides pose a risk to pollinators if inappropriately applied, recent concerns have focused on the risks associated with the widespread use of a class of systemic insecticides, the neonicotinoids. Although the type and intensity of pesticide use varies across Ireland, there has been no field-level research on their impacts on pollinators in Ireland. The only Irish research related to pesticides and pollinators looked at organic dairy farms and found that they had higher numbers of both flowers and insects.

Continued research into Irish agricultural systems, chemical controls and the effect on pollinators is essential to future management of our pollinator resource.

Climate change - Changing environment

Recent studies have shown that wild pollinators are highly vulnerable to climate change. The impact of climate change on pollination service can be difficult to predict. However, with likely changes in the timing of flowering, the occurrence of important life cycle events of pollinators (e.g. emergence from hibernation, production of offspring etc.), and the geographic ranges of plants and pollinator species, there is the potential for mismatches between plants and their pollinators, as well as risks associated with more frequent severe weather events (e.g. storms, floods, late frosts etc.). This means that crops or wild plants may flower before their pollinators emerge from hibernation; or the pollinators themselves may emerge first and find it difficult to survive due to a lack of food sources if the crops or wild plants are not yet flowering. Within habitat restoration work in which wild flowers are deliberately planted within the landscape, it is preferable to use locally collected seed as it is more likely to be in sync with the local climatic conditions. It is important to increase the connectivity and quality of pollinator friendly habitats so that pollinators can move in response to climate change and we retain as much resilience within our ecosystems as possible.
What are our options?

If we don’t take action on pollinator declines this could potentially reduce crop pollination and hence production, resulting in a loss of consumer choice for Irish grown products. If declines continue, it is extremely unlikely we would run out of food, but it would mean farmers would find it increasingly difficult and expensive to produce some crops at the current levels of scale. Pollinators also maintain the diversity of wild plants and support healthy ecosystems. Continuing declines will have knock-on impacts for a range of ecosystem services. We do not fully understand the range and magnitude of potential knock-on effects, making it highly risky to take no action.

The most cost-effective option is to develop an Irish landscape where pollinators can survive and thrive. This will also have positive knock-on benefits for other biodiversity and ecosystem services, but it will require a series of actions that need to be implemented. A shortage of nesting sites and suitable food plants are among the main drivers of decline in wild pollinators. This could be reversed by large-scale restoration of pollinator habitat – essentially this means a collective effort to create a mosaic of nesting areas and flower-rich habitat across our landscape to support both wild pollinators and managed honeybees. This is the solution proposed by this Plan.

Substituting insect pollination with manual hand-pollination or with commercially reared colonies of bees is not a viable option in Ireland. Hand-pollination is unfeasible even for crops, let alone wild plants. Studies indicate that pollination service cannot be maintained by honeybees alone\(^2\) and whilst using commercial colonies may be possible for bumblebee-pollinated protected crops (e.g. soft fruits), there are associated risks to farmers in relying on colonies being available for import, and to wild bees which may face competition and pest/disease spillover\(^5\). Alternatively, non-pollinator dependent varieties could be substituted for the pollinator-dependent ones, but the value of the latter is greater\(^1\) and would result in pollinator-dependent crops being imported. This is expensive (in economic terms and with respect to carbon emissions) and with future transport costs likely to rise, it is not a sustainable solution.

We need to adopt evidence-based best practices from around the world
Do we know how to make Ireland pollinator friendly and reverse declines?

Reversing pollinator declines in Ireland will require us all to take collective action. Worldwide, the number of studies testing a variety of management options to improve pollinator populations is continually growing. Therefore, we now have a suite of evidence-based actions that have been shown to promote pollinator populations in other countries and provide an ideal starting point for conservation actions within Ireland. National Pollinator Strategies have also recently been published in Wales (2013) and England (2014) making it possible to draw on experiences elsewhere.

The most cost-effective solution is to change our management practices to increase the wildflowers that grow naturally within the landscape; and to retain or create natural nesting habitat for our pollinators. Where direct intervention is required, best practice examples include:

- **Plant patches of urban areas with wildflowers.** Evidence from Scotland showed that patches planted with wildflower seed mix had x25 more flowers, x50 more bumblebees and x13 more hoverflies compared with plots where wildflower seed had not been sown55.

- **Incorporate pollinator friendly plants into gardens.** Nineteen of the 25 different plant species trialed in British gardens were found to be of particular value to insect pollinators54.

- **Allow lawn weeds to flower.** Evidence from the USA showed that Dandelions and White Clover on lawns supported 37 species of bee. White Clover was important for bumblebees and honeybees, whereas solitary bees, honeybees and hoverflies predominated on Dandelion57.

- **Incorporate wildflower strips within cropped fields.** Evidence from the USA showed that wildflower strips sown within 3m of blueberry crops can, after three to four years, attract almost double the abundance of wild bees and hoverflies, and increase fruit set by 10% with an estimated net profit of US$8,750 per 0.8 ha of wildflower patches after 10 years58.

- **Allow field margins to grow wild.** Evidence from the UK showed that naturally regenerated field margins supported over 2.5 times the abundance of flowers and 3-16 times the abundance of bees, compared to field margins with reduced spraying regimes and no input of fertilizer59.

- **Incorporate clovers into grass-dominated swards.** Evidence from the UK showed that permanent pasture sown annually with a mix of legumes, or grass and legumes, supported over 6.5 times the abundance of bumblebees compared to seven other grass management options60.

- **Incorporate artificial solitary bee nests into urban gardens.** Evidence from the UK and Ireland shows that nest boxes can be occupied by small numbers of cavity nesting solitary bees61,62.

In Ireland, solitary bee nest boxes will only attract the very small number of species who are cavity nesters. Over 80% (62 species) of Ireland’s solitary bees are mining bees, who simply require bare ground or stable south facing slopes of bare substrate (soil, sand, clay or peat) for nesting.

---

**10 of the 77 solitary bee species, only are likely to use a garden nest box.**
What progress have we made so far in Ireland?

The number of pollinator initiatives in Ireland has been increasing in recent years, and progress has already been made in a number of areas:

- An All-Ireland Bee Red List was published in 2006. It stated the conservation status of all species and identified those that are most at risk of extinction.
- The EU and Irish Government co-funded National Apiculture Programme has collected data on Irish honeybee colony losses each year since 2008. It is also looking at ways to address the causes for these losses.
- The Native Irish Honey Bee Society (NIHBS) was established in 2012 to support the various strains of Native Irish Honey Bee (Apis mellifera mellifera) throughout the country.
- An EU neonicotinoid regulation is currently in place that bans the use of three of the neonicotinoid insecticides on flowering crops attractive to bees.
- The Irish Pollinator Initiative was set up by the National Biodiversity Data Centre in 2011 and is actively working to drive pollinator conservation through better data. One of the components of this initiative is the All-Ireland Bumblebee Monitoring Scheme which has been monitoring wild pollinators across the landscape since 2011. Along with a GB equivalent, it is the first scheme of its kind in Europe. Currently more than eighty volunteers walk a 1-2km fixed route once a month and record the bumblebee diversity and abundance that they observe.
- Since 2003, the ‘Plant-Animal Interactions’ research group in Trinity College Dublin has been researching the drivers and consequences of pollinator decline in Ireland and has published >30 scientific papers on Irish pollinators and pollination services.
- On the ground, sectors such as agriculture are beginning to take pollinator specific action through Agri-environment initiatives and through the development of a National Action Programme for the sustainable use of pesticides which will also have benefits for pollinators. The Ulster Beekeepers Association and Ulster Farmers Union have worked together to produce a ‘Farming for Bees’ information leaflet promoting pollinator friendly actions and also highlighting advice from the voluntary pesticide use scheme.
- Local authorities are increasingly embracing pollinator friendly management plans, and transport authorities have adopted biodiversity initiatives along national road networks. Local schemes (e.g., Don’t Mow Let it Grow; Wexford County Council - Life Lives On The Edge) have encouraged pollinator friendly actions along roadside verges and in public spaces. Local initiatives in schools and communities (e.g., Limerick’s Buzzing) have also increased; and the public is becoming more aware of actions they can take in their own gardens to help Ireland’s pollinators.

This plan aims to capitalise on the progress that has been made to date, coordinating our efforts into a cohesive All-Ireland strategy that will take positive steps for pollinators over the next 5 years, and inform future actions beyond then.

All-Ireland Pollinator Plan 2015-2020 – creating an Ireland where pollinators can survive and thrive
A call to action

This is a shared plan of action. At its core, it is about providing food and shelter across all types of land so that Irish pollinators can survive and thrive. Everyone has a role to play. By working together we can collectively take steps to reverse pollinator losses and help restore populations to healthy levels.

The main objective of the Plan is to make Ireland pollinator friendly by taking actions on farmland, public land and private land.

This will be supported by additional actions across four other objectives. Within each objective, targets have been set and actions have been identified to help achieve that target. A total of 24 targets and 81 actions are identified.

Organisations who have volunteered to accept responsibility are stated, but in all cases there is scope and space for others to get involved and play a role in delivery. It is hoped that over the life of this Plan new initiatives and new ideas to address each target will be identified and implemented.

Progress will be measured in terms of the number of actions that are achieved; and by changes in the abundance of wild and managed pollinators in the landscape. This Plan is about working together and achieving as much as we can for Irish pollinators by working strategically and cohesively over the period 2015-2020.

www.biodiversityireland.ie/pollinator-plan

1 Making Ireland pollinator friendly: By taking action on farmland, public land and private land, we want to achieve a joined-up network of diverse and flower-rich habitats to support pollinators across Ireland:
   1.1 Farmland: 4 targets & 12 actions
   1.2 Public land: 3 targets & 22 actions
   1.3 Private land: 2 targets & 5 actions
   1.4 Supporting the creation of pollinator friendly habitats: 1 target and 3 actions

2 Raising awareness of pollinators and how to protect them: 3 targets & 11 actions

3 Managed pollinators – supporting beekeepers and growers: 4 targets & 7 actions

4 Expanding our knowledge on pollinators and pollination services: 4 targets & 11 actions

5 Collecting evidence to track change and measure success: 3 targets & 6 actions

Some core actions will be completed by spring 2016 (these are marked *), with the remaining actions completed within the life of the Plan (pending funding where this is relevant).
Making Ireland pollinator friendly

All types of land use can become more pollinator friendly. Whether you own a farm or a window box, everyone can play a role in making Ireland a place where pollinators can survive and thrive. Together these patches can become a national network of pollinator habitat. Pollinators need places with flowers to feed and suitable habitat to complete their lifecycles. They also need to be protected from chemicals that are toxic to them.

Targets have been set for farmland, public land and private land. The people that will be involved and the action to be taken to meet each target are explained below.

1.1 Making Ireland Pollinator Friendly: Farmland

Farmers are in an ideal position to help improve the quality and amount of diverse and flower-rich habitat for pollinators.

Farmland targets for 2015-2020

1.1.1 Increase the area of farmland that is farmed in a pollinator friendly way
1.1.2 Create a network of meadows and other flower-rich habitats to serve as pollinator havens
1.1.3 Encourage the sustainable use of agricultural pesticides (insecticides, herbicides & fungicides)
1.1.4 Provide clearer information on pollinators to the farming community

TARGET 1.1.1

</tbody>
</table>
**Agri-environment schemes:** Pollinator friendly actions and prescriptions have been incorporated into the new Green Low Carbon Agri-Environment Scheme (GLAS) in the Republic of Ireland, and the Environmental Farming Scheme (EFS) in Northern Ireland.

**Voluntary actions for farmers**

These are general actions that can be taken to make your farm more pollinator friendly. Additional specific actions will be prepared for each sector (dairy, beef, tillage, sheep, horse, soft-fruit growers, orchards).

1. **Maintain good quality hedgerows:** flowering hedgerows that contain Hazel, Willow, Blackthorn and Hawthorn provide food in spring when wild bees come out of hibernation. Bramble is a good source of food in summer, and Ivy in the autumn. Cut hedgerows every three years, or cut a third annually. The base of the hedgerow shouldn’t be sprayed to leave flowering plants like Clovers, Vetches and Knapweed which provide additional food throughout the season. Keep any sandy, earth, or earth and stone banks to provide nest sites for solitary bees.

2. **Allow wildflowers to grow around the farm:** flowers/weeds like Dandelion, Clovers, Knapweed, Vetches and Creeping thistle growing along lanes and in field corners provide vital food sources for bees.

3. **Plant nectar and pollen rich trees and shrubs:** good native species are Willow, Hazel, Hawthorn, and Blackthorn. Fruit trees are also a great food source.

4. **Provide nesting areas around the farm:** bumblebees nest in patches of long tussocky grass or nettles. Most Irish solitary bees nest on bare ground that isn’t too compacted, or in south/east facing banks of bare earth (soil, sand, clay, peat).

5. **Maximise wildflowers within field margins/buffer strips:** cut field margins and buffer strips only once or twice; cutting should ideally occur before April, with a late cut taken in early September (ideally followed by aftermath grazing). This gives wildflowers a chance to set seed, retains late forage sources for pollinators, and avoids disturbance of late stage bumblebee nests.

**These are general actions that can be taken to make your farm more pollinator friendly**
**TARGET 1.1.2**

**ACTION**
A5. Promote existing species rich habitats as a haven for pollinators

**PROGRESS MEASURE**

- Promotion of the NI scheme: Save our Magnificent Meadows
- Increase in the number of participating sites
- Development of a network of regional demonstration sites
- Provision of a ‘how-to’ guide on how to create and manage a species rich meadow
- Investigation of funding sources with a view to expanding Save our Magnificent Meadows to new areas
- Development of an online map showing the location of all species rich habitats within existing and future schemes [Action 76] *

**RESPONSIBILITY**
Ulster Wildlife, NIEA, DARD, BCNI, Fermanagh and Omagh District Council, European Forum for Nature Conservation and Pastoralism, UW, NIEA, other partners as appropriate, National Biodiversity Data Centre (IPI)

---

**TARGET 1.1.3**

**ACTION**
A6. Encourage the responsible and sustainable usage of pesticides (insecticides, herbicides & fungicides) in Ireland

**PROGRESS MEASURE**

- In conjunction with the National Action Plan for the Sustainable Use of Pesticides, develop best-practice guidelines for farmers to reduce their use outside of cropping systems to minimise risk to pollinators.
- Support existing work to raise awareness on the responsible use of pesticides within agriculture by enhancing online resources to provide clear and simple guidelines
- Within NI, support the UK wide Voluntary Initiative on Promoting Responsible Pesticide Use
- Maintain data on the pesticides that are used in Ireland, where they are used, and what for

**RESPONSIBILITY**
DAFM, DAFM, AFBI, National Biodiversity Data Centre (IPI), UFU, AFBI, DAFM

---

Restoring meadows: Save Our Magnificent Meadows is the UK’s largest partnership project transforming the fortunes of vanishing wildflower meadows, grasslands and wildlife. Led by Plantlife, the partnership of 11 organisations including Ulster Wildlife, is working to restore 6,000 hectares of wildflower meadows and grasslands, primarily funded by the Heritage Lottery Fund. The project aims to protect, conserve and restore wildflower meadows, and provides a model for how this target may be met. During the 3 year project (2014 to 2017), partners will continue to develop and promote the scheme to increase the number of participating sites. These sites will serve as a network of regional demonstration sites and act as hubs for pollinator conservation. Within the Republic of Ireland a new initiative or expansion of the Magnificent Meadows Project is required to meet this objective. Funding sources to achieve such a network of grassland sites will need to be investigated e.g., European Regional Development Fund (INTERREG).

The NI project aims to influence the management of 250 hectares of meadow and rush pasture. Sites within the project include publicly owned, private farmland, school grounds and roadside verges. The project will therefore also contribute to targets 1.2.1 and 1.2.2.
### TARGET 1.1.4

<table>

</thead>
</table>
| A8. Establish a farming subgroup to discuss the best ways to ensure the Irish agricultural landscape retains sustainable pollinator populations into the future * | • Establish the subgroup with invitations extended to representatives from the IFA, UFA, Macra na Feirme, The Soft Fruit Growers Association, the horse farming sector & Women in Agriculture, and well as representatives of intensive and non-intensive farmers across sectors  
  • Group to discuss:  
    · Mechanisms for implementation of the Plan & identification of any issues that minimise the chance of success  
    · Pollinator actions for incorporation into future agri-environment schemes  
    · How best to communicate the message to the farming community | Steering group |
| A9. Provide clear information on actions that can be taken on farms to make them more pollinator friendly | • Creation of on-line resources providing clear guidelines on actions that can be taken on all farms, along with additional actions specific to farm type *  
  • Dissemination of these resources in an appropriate way to the farming community *  
  • Ballyhoura Development Ltd. to pilot a peer to peer approach for communicating pollinator information to farmers  
  • Investigate potential mechanisms for providing training on pollinators and pollinator friendly management to farm advisors  
  • Development of cost-benefit analyses providing farmers with information on the cost implications of management actions | National Biodiversity Data Centre (IPI), Teagasc, Ballyhoura Development Ltd., other partners |
| A10. Adoption of pollinator friendly management within agricultural and horticultural college sites as a teaching & awareness raising tool | • Uptake by participating colleges  
  • Promotion as reference sites | CAFRE, Teagasc |
| A11. Provide farmers with information on which pollinators are most important for each Irish crop species, including new crops which may increase in cultivation in the future | • Establishment of a publicly available All-Ireland Database on plant-pollinator interactions with an emphasis on crop species. This database will indicate all known pollinators and flower visitors of crops and wild plants, with the most effective pollinators highlighted where this information is available  
  • Populate as research data becomes available [Action 65] | Plant Animal Interactions research group (TCD) & National Biodiversity Data Centre (IPI) |
| A12. Provide farmers with a system that will indicate potential crops based on geographic area, known pollinator distribution, and floral resource availability. This system will also flag areas where lack of pollinators is likely to be a limiting factor. | • Completion of research on the most appropriate methodologies [Actions 65,66,67]  
  • Development of a framework for an integrated GIS based system that will combine data sources in this model  
  • Populate as data becomes available  
  • Identification of future data needs | National Biodiversity Data Centre (IPI) & Plant Animal Interactions research group (TCD) |

**Note:** this is a research action that will be dependent on funding.

**Target 1.1.4:** Provide clearer information on pollinators to the farming community
1.2 Making Ireland Pollinator Friendly: Public Land

Adopting pollinator friendly management practices on public land such as roadside verges, parks and schools can play a vital role. Road networks in particular have huge potential to create linking areas of flower-rich habitat and help achieve our aim of a joined-up network of pollinator friendly sites across Ireland.

Public land targets for 2015-2020

1.2.1 Increase the area of public & semi-state land that is managed in a pollinator friendly way

1.2.2 Create linking areas of flower-rich habitat along transport routes

1.2.3 Reduce the use of pesticides (insecticides, herbicides, fungicides) on public land

Specific guidelines for pollinator friendly management will be developed for each sector/organisation [Action 51]. A series of ‘how-to’ guides for specific actions will also be developed [Action 52]. The Data Centre will provide a publicly available online system where all site based actions taken can be logged and pollinator friendly areas mapped and recognised [Action 76]. Actions 51, 52 and 76 will all be completed by spring 2016.

Note: this is a research action that will be dependent on funding

A27. Promote the Pollinator Plan to other organisations involved in managing public or semi-state land | • Increase in the number of other organisations supporting the Plan | Steering group |

Examples of pollinator friendly actions that can be taken on public land.

1. The most important action that can be taken on public land is to reduce the frequency of mowing to allow wildflowers to grow. Where possible, grassy areas should only be mown once or twice annually. They should be cut in early September to allow wild plants to flower and set seed. If doing an early cut, mow in late spring after the first flush of dandelions. Remove grass when cut in order to reduce coarse grasses and increase wildflower diversity. On a wildflower-rich site, where feasible, grass should be turned after cutting to allow seeds to fall. Allow grassy areas to grow and carry out an initial species survey to determine if a seed mix is required. Where appropriate, mow paths through wildflower meadows so that the public can visit and enjoy the resource.

2. Plant a suite of pollinator friendly trees and shrubs that will flower throughout the pollinator season.
3. Reduce or eliminate the use of pesticides (insecticides, herbicides & fungicides) and fertilizers.
4. Maintain or create good quality hedgerows.
5. Create wild pollinator nesting habitat – areas of long grass for bumblebees; compacted bare soil or south/ east facing banks of bare earth (soil, sand, clay, peat) for mining solitary bees; south facing stone walls, masonry, wooden structures or commercially available nest boxes for cavity nesting solitary bees.

**1.3 Making Ireland Pollinator Friendly: Private Land**

Protecting the future of pollinators requires action by all of us. Whether you have a window box, multiple business properties or a golf course, you can play a role.

**Private land targets for 2015-2020**

1.3.1 Increase the number of gardens across Ireland that are pollinator friendly

1.3.2 Encourage businesses to become pollinator friendly
A39. Encourage business properties to make their outdoor spaces more pollinator friendly (including country hotels, golf courses, quarries, retail carparks)

- Provision of guidelines for pollinator friendly management of general outdoor spaces that are appropriate for business. Developed in packages that are in line with the environmental systems used in many businesses (such as ISO 14001/ BS8555). *
- Achieve a target of 60 businesses signed up by 2020
- Develop case studies across business types
- Develop specific guidelines for the following: golf courses, country hotels, retail carparks, quarries *

As part of the development of this plan, the following businesses have already agreed to adopt pollinator friendly actions within their properties:

- ABP food group – Ireland
- Individual businesses

- Disseminate this information to the business community

Bord Bia

Examples of pollinator friendly actions that can be taken in gardens:

1. Grow more flowers, shrubs and trees that provide nectar and pollen for pollinators. Try to make sure that your garden has at least one flowering food source from spring right through to winter e.g., Willow (early spring) – Dandelion (spring) – Clovers (early summer) – Lavender (late summer) – Ivy (autumn) – Mahonia (winter).

2. Leave small areas of your lawn uncut to allow plants like Clover and Bird’s-foot trefoil to flower. Don’t view Dandelions as a weed but as a vital spring food source for pollinators.

3. If your garden is large enough, let areas grow wild with long grass to create nesting habitat for wild pollinators.

4. Avoid using pesticides. Where absolutely necessary, use them sparingly. Always follow the instructions closely and try to avoid applying pesticides at times of the day when pollinators are active or when plants are in flower.

5. Try to avoid disturbing nesting or hibernating pollinators in areas like grass margins, bare soil, dead wood or walls.

It is hoped that ARENA Network, Business in the Community NI can get involved in A39, but it is dependent on organisational funding.
1.4 Supporting the creation of pollinator friendly habitat

Actions have been identified to make farmland, public land and private land more pollinator friendly. Many of these actions will involve changes in management practice to allow natural regeneration of wildflowers and areas of nesting habitat. Where direct intervention is required, additional supporting actions are necessary to maximise the chance of success.

**Notes:** For actions that involve deliberately planting pollinator-friendly wildflowers on natural, semi-natural and agricultural land, local provenance native wildflower seed should be used. This means that the seed used is sourced in Ireland from native species. For local authorities, farmers, or other land managers one of the biggest constraints can be machinery to manage hay meadows or larger wildflower meadows.
### Raising awareness of pollinators and how to protect them

We need to raise public awareness so that people and organisations know how to help pollinators. Pollinators need access to food supplies from February to October when they are active. They also need places to shelter and nest during this period, and over the winter. Based on actions that have been shown to promote pollinator populations in other countries, we need to produce clear guidelines for farmers, land managers, gardeners and members of the public. Guidelines will build upon work carried out in other jurisdictions to ensure good practice and see existing resources used to their fullest extent.

#### Raising awareness targets for 2015-2020

1. Increase the number of people who are aware of pollinators and who understand the need for pollinator conservation
2. Promote education on pollinators and their conservation at primary, secondary and tertiary level
3. Provide clear information to different sectors on how to take action to protect pollinators

#### TARGET 2.1

| A49. Produce pollinator educational materials that can be used within the curriculum of primary and secondary schools | • Preparation of material  
• Investigation of platforms and methodologies of delivery to build on existing initiatives | An Taisce Green-Schools, Eco-Schools, OPAL, Learning Through Landscapes (Polli:Nation) with assistance from other partners |
| A50. Incorporate material on the identification and conservation of pollinators within agricultural and horticultural colleges | • Incorporation within appropriate curriculums  
• Use of this material to raise awareness among all farmers  
• Provide optional Bumblebee Monitoring Scheme training to raise awareness of wild pollinators and as a means to monitor the success of any pollinator friendly management actions implemented | CAFRE, Teagasc  
National Biodiversity Data Centre |
| **TARGET 2.3** | | |
| A51. Develop tailored suites of pollinator friendly management actions for all sectors and make available online | • Publication of guidelines for pollinator friendly management across all sectors  
• Investigate mechanisms to provide certification (where appropriate) to sites taking pollinator actions | National Biodiversity Data Centre (IPI) & partners |
| A52. Provide detailed ‘how-to’ guides for specific actions | • Publication online of a series of ‘how-to’ guides for implementation of key pollinator actions | National Biodiversity Data Centre (IPI) & partners |
| A53. Provide training courses on pollinator friendly management options across sectors | • Provision of training courses to accompany the respective ‘how-to’ guides (hedge laying, wildflower meadow creation, creation of nesting bee habitats, roadside verge management etc.) | Relevant partners |

Note: this action is resource dependent & requires identification of funding sources.

Target 2.2: Promote education on pollinators and their conservation at primary, secondary and tertiary level.

Target 2.3: Provide clear information to different sectors on how to take action to protect pollinators.
**Managed pollinators - supporting beekeepers and growers**

Managed pollinators have an important role to play in maintaining pollination service in Ireland. We need to support beekeepers in collecting data, and in improving the management of pest and disease risks. The importation of managed bees needs to be carefully regulated and increasingly restricted to native subspecies. New pests and diseases pose a continual threat (e.g. small hive beetle). Where importation of bees is necessary it is vital that existing Irish populations are protected through health screening, certification of all imports, and reproductive isolation from native populations.

**Targets to support beekeepers & growers 2015-2020**

4 Expanding our knowledge on pollinators and pollination services

The actions in this plan are based on studies that have been shown to promote pollinator populations. However, there are still gaps in our knowledge. In some situations we simply don’t know the best management solution in the Irish context; in others we don’t have a clear understanding of the full impact of further pollinator declines. We need to continually address these gaps through research so that we know the best and most cost-effective ways to protect our pollinators into the future.

Note: research actions are resource dependent & require identification of funding sources.

</tr>
</tbody>
</table>
Collecting evidence to track change and measure success

This Plan is about creating an Ireland where pollinators can survive and thrive. To measure success we need baseline data of where pollinators occur and how abundant they are, and we need to monitor how that changes into the future. That is the ongoing goal of the Irish Pollinator Initiative which was set up by the National Biodiversity Data Centre in 2011 to drive pollinator conservation through better data.

In parallel to tracking changes across the landscape, it is important that we track the impact of implemented actions made on farmland, public, semi-state and private land to the diversity and abundance of our pollinators.

By tracking change on a site basis we can determine what works best, and future actions can evolve to become as effective as possible.

Tracking change targets 2015-2020

5.1 Build taxonomic capacity so that we can collect better information on our pollinators
5.2 Monitor changes in the abundance and distribution of wild pollinators across Ireland
5.3 Provide mechanisms to track progress in implementation of the Plan

### TARGET 5.1
**ACTION**
A72. Increase the number of active recorders who can accurately identify pollinator species

**PROGRESS MEASURE**
- Run annual identification workshops and field-based events
- Increase the number of online identification resources available through the IPI

**RESPONSIBILITY**
National Biodiversity Data Centre (IPI), CEDaR, CIEEM & relevant partners

### TARGET 5.2
**ACTION**
A73. Maintain data on wild pollinator distribution and make available through an online Atlas of Irish pollinators

**PROGRESS MEASURE**
- Growth of the All-Ireland bee database
- Growth of All-Ireland hoverfly database
- Display of information through an online Atlas of Irish pollinators

**RESPONSIBILITY**
National Biodiversity Data Centre (IPI)

Target 5.1: Build taxonomic capacity so that we can collect better information on our pollinators

Target 5.2: Monitor changes in the abundance and distribution of wild pollinators across Ireland
### Target 5.2

**ACTION** | **PROGRESS MEASURE** | **RESPONSIBILITY**
---|---|---
A74. Monitor wild pollinators across the landscape to detect the early warning signs of a threat to Irish pollination service | • Continue to support and grow the All-Ireland Bumblebee Monitoring Scheme  
• Provide training to all interested parties | National Biodiversity Data Centre (IPI)

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

</table>
|  | Development of a system where all those who have taken pollinator friendly actions (farmers, schools, land managers, individuals) can log their location and the action(s) taken.  
System to be interactive and show progress in the creation of pollinator friendly habitat across the landscape | National Biodiversity Data Centre (IPI)

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
</table>
|  | Provide a framework for individuals or organisations to monitor the impacts of site based actions to create pollinator habitat within farmland, public and private land in terms of changes in wild pollinator populations present (Action 74)  
• Use of the emerging online map of pollinator friendly habitat (action 76) to direct future actions to the most appropriate areas  
• Where sites are being monitored and actions are not proving effective, this to be investigated so that future actions can become as effective as possible | National Biodiversity Data Centre (IPI) & partners

---

*Target 5.3: Provide mechanisms to track progress in implementation of the Plan*
Delivery Of The Plan And Measuring Progress

The All-Ireland Pollinator Plan is voluntary. Organisations who have endorsed an action take responsibility for its delivery.

Some goals may be achieved using existing policies and initiatives. Others will require us to do things differently and to develop new projects and find new sources of funding.

The following general actions are identified:

<table>
<thead>
<tr>
<th>TARGET 5.1</th>
<th>ACTION</th>
<th>PROGRESS MEASURE</th>
<th>RESPONSIBILITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>A78.</td>
<td>Annually review the steering group</td>
<td>• Review the steering group annually and expand/restructure as required</td>
<td>Steering group</td>
</tr>
<tr>
<td>A79.</td>
<td>Establish a subgroup on funding and innovation to progress the funding needs within implementation of the Plan *</td>
<td>• Establish a subgroup to investigate existing funding options (e.g., Cap II, LIFE, INTERREG) and discuss future innovations</td>
<td>Steering group</td>
</tr>
<tr>
<td>A80.</td>
<td>Incorporation of the Pollinator Plan into future relevant national strategies</td>
<td>• Promotion of the Plan to relevant organisations</td>
<td>Steering group</td>
</tr>
<tr>
<td>A81.</td>
<td>Renew the Plan in 2020</td>
<td>• A new version of the Pollinator Plan to be developed for 2020-2025</td>
<td>Steering group</td>
</tr>
</tbody>
</table>

The steering group will oversee progress within the Plan through:

- Publication of a mid-term review at the beginning of 2018
- Development and use of an online management system to track progress in the 81 actions within this Plan. Those organisations with responsibility for actions will be requested to submit short annual progress reports into the system by the 30th November each year, beginning 2016.
- Organisation of a biennial event where those involved in implementation of the Plan can get together and report on progress [action 44].
- Mechanisms will be created to measure the number of individual site based actions that are taken [action 76]. This Plan aims to create a joined-up network of diverse and flower-rich habitats to support pollinators across Ireland. An online map of pollinator friendly sites will track progress towards this goal.
- Ultimately, success will be measured in increases in the abundance and diversity of pollinators within the Irish landscape [actions 73 and 74].
